6

- X Amar wants to present a paper on **Climate Change and Indian Agriculture** in an International Seminar. Prepare three slides based on the information given below.

Climate change is any significant long-term change in the expected patterns of average weather of a region over a significant period of time. In recent times, the rate of climate change is at a much faster pace on account of emission of greenhouse gases caused by industrialisation, urbanisation, deforestation etc. India's agriculture has been dependent on monsoon. But the changes in monsoon trends along with increase in temperature levels severely affect Indian agriculture. The major impact of climate change is on rain fed or un-irrigated crops which are cultivated on nearly 60 percent of cropland. Increased droughts and floods are likely to affect the productivity rate of most crops. Immense variations in temperature also result in a drastic decrease in the production of crop yields. Any change in the climatic parameters will have a direct impact on the quantity of food produced and this will ultimately affect the food security of the country. Coping with the impact of climate change on agriculture will require careful management of resources like soil, water and biodiversity.
